SUMMARY

BCA student with a strong foundation in Java and object-oriented design, building Android applications and exploring AI/ML through independent projects. Placed Top 7 nationally at the IEEE SIGN2SOUND AI Hackathon. Comfortable with Java, Python, SQL, and full-stack web development.

EDUCATION

KSV University, Gandhinagar

Pursuing **Bachelor of Computer Applications (BCA)** Expected Graduation: 2027

CGPA: 8.5/10

SKILLS

Languages: Java, Python, PHP, SQL

AI/ML & Data: PyTorch, OpenCV, MediaPipe, Prompt Engineering

Tools & Platforms: Git/GitHub, Linux, Android Studio, XAMPP

PROJECT

DayFlow – Workout & Fitness Timer[\[GitHub\]](#)

Technologies: **Java, Android Studio, XML, JSON**

- Built an Android workout tracker in Java with a layered architecture separating data models, business logic, and persistence
- Implemented a stateful timer system supporting start/pause/resume/reset per exercise, with independent countdown and rest-period timers
- Built date-based workout planning where past days lock read-only and future days remain editable
- Used Gson for local JSON serialization of nested workout data

SIGN2SOUND – AI-Powered Sign Language Recognition[\[GitHub\]](#)

Technologies: **Python, PyTorch, OpenCV, MediaPipe, Vosk**

- Built a multimodal accessibility system performing real-time Speech→Text (Vosk) and Sign→Text (MediaPipe + LSTM) recognition for Indian Sign Language fingerspelling
- Trained an LSTM model (2 layers, 256 hidden units) on two-hand skeletal landmark sequences across 25 alphabet classes, achieving ~75% validation accuracy over 40 epochs
- Built the real-time OpenCV inference interface with live sign prediction, temporal smoothing, and speech transcription display
- Built for the IEEE SIGN2SOUND AI Hackathon, placing Top 7 nationally

PulseFit – AI Diet Planner[\[GitHub\]](#)

Technologies: **AI-assisted development (Antigravity), Google Gemini API, PostgreSQL, JWT**

- Designed an AI-assisted gym diet-planning platform generating personalized 7-day nutrition plans from customer intake data
- Implemented calorie and macronutrient targeting using the Mifflin–St Jeor BMR/TDEE formula, feeding structured targets into Google Gemini for meal-plan generation
- Architected the system across a calculation engine, AI generation layer, and PostgreSQL persistence, using an AI-assisted development workflow with extensive prompt engineering and iteration
- Supported multilingual output (English, Hindi, Gujarati), dietary restrictions, and gym-branded printable plans
